

Termite Inspections

Termite Inspection

Kwik Kill Exterminating Company's Termite inspection program will evaluate the presence of termite damage, or termite colonies in a home. State-certified consultants provide homebuyers with accurate and detailed inspection reports that use simple, consistent terms and are easy to understand.

Termites eat wood, and can consequently cause great structural damage to your home if left unchecked. A typical homeowner's insurance policy does not cover destruction caused by termites, even though they cause over 1 billion dollars in damage to homes throughout the United States each year. Our inspection and treatment program can help you understand the threat of termites, and take the necessary steps to protect your home.

See the Chemicals we use

Termite Treatment

You can't assume your home is termite-free just because you've never seen them – they only swarm once or twice a year, and you might miss it!

Based on the layout of your home and the degree of termite infestation, Kwik Kill Exterminating Company will create a customized treatment plan to effectively control termites in your home. Some of the things we look for are:

- Mud tubes built for traveling above ground

- Damaged or hollow-sounding wood

- Pinholes in drywall or wallpaper

- Small piles of sawdust

- Piles of small wings

- Other specific termite indicators

Pre-Construction Termite Treatment

At Kwik Kill Exterminators we believe prevention is always wiser no matter what pest you have to deal with, but this is especially true with termites. There is no absolute, 100% way to prevent termites from infesting your home; however, let Kwik Kill Exterminators pre-treat your property before the structure is built or before an addition is added, this can improve your chances of staying termite free.
